A buffer contains $\mathbf{0 . 2} \mathbf{~ m o l}$ of acetic acid and $\mathbf{0 . 4} \mathbf{~ m o l}$ of sodium acetate per liter ( $K_{a}=1,8 \mathbf{x}$ $10^{-5}$ ).
(a) Calculate the pH of the buffer.
(b) Calculate the change in $\mathbf{p H}$ when 10 mL of 0.2 M HCl is added to 1 L of the buffer.
(c) What pH change would you expect if you added the same quantity of HCl to 1 L of pure water?
